

What is female urology?

The subspecialty of female urology is concerned with the diagnosis and treatment of those urinary tract disorders most prevalent in females. These include urinary incontinence and pelvic floor prolapse, voiding dysfunction, recurrent urinary tract infection, urethral syndrome and interstitial cystitis. Expert evaluation of these conditions includes a complete history and physical exam. Urodynamics (bladder function test) and imaging studies may be required to fully evaluate the urinary tracts. Additional bladder studies such as cystoscopy may be necessary.
